I. *Read the following passage carefully and answer the question given below:*

What is Anti-Virus Software?

Anti-virus software is a program or set of programs that are designed to prevent, search for, detect, and remove software viruses, and other software like worms and trojans.

The Anti-Virus software must be installed and updated on a computer system because a computer without anti-virus software will be infected within minutes of connecting to the internet.

There are several different companies that build and offer anti-virus software and what each offers can vary, but all perform some basic functions. Some of these functions are listed below:

- Scan specific files or directories for any viruses or worms
- Allow you to schedule scans to automatically run for you
- Allow you to initiate a scan of a specific file or of your computer, or of a CD or flash drive at any time.
- Remove any Malware. Malware is any software used to gain access to your private information and manipulate them on a computer system.
- Show you the 'health' of your computer

Sometimes you will be notified of an infection and asked if you want to clean the file, other programs will automatically do this.

Always be sure you have the best, up-to-date security software installed to protect your computers, laptops, tablets and smartphones.

Questions:

1. What is an antivirus software?

    a. A computer program to detect and remove the viruses and worms from your computer.
